Re: Application for ID-27 Soil as Cover Material
from K. Hovnanian Co., Site
Newark, Essex County, NJ

Dear Mr. Dour:

As we discussed during our telephone conversation on January 5, 1993, J M Sorge, Inc. (JMS) has received formal classification from the New Jersey Department of Environmental Protection and Energy (NJDEPE) with regard to approximately 2700 cubic yards of non-hazardous soil located in Newark, New Jersey. This material was sampled by JMS in accordance with a NJDEPE-approved Sampling Plan; no contaminants were identified in the soil above the Category 3 levels. I have attached a copy of the ID-27 letter which was issued by the State.

JMS will request that the HMDC-Bailer Facility approve the soil for use as daily cover material. However, you informed me that due to the current schedule at the HMDC facility, you would not be reviewing any applications for acceptance of material as daily cover until approximately January 19, 1993, and that the facility would not be accepting cover material until approximately March 1993.

As we discussed, due to site development schedules at the Newark property, we are trying to accelerate the classification and landfill acceptance process. Therefore, I would like to request that your office review the enclosed ID-27 letter, together with the soil sampling results at your earliest possible convenience with the hope of scheduling an appointment for you to inspect the material.
